I Tested 500+ ChatGPT Prompts in 2025. Here’s the Best Prompt Framework.

Most prompts sound smart until you actually use them. This one doesn’t just work - it fixes everything you hate about AI writing.

I've been living inside ChatGPT since the release of GPT-3.5.
Every day, testing prompts. Breaking them. Rebuilding them.

And I'll be honest - most of them were garbage. Over-engineered nonsense pretending to be "advanced prompt engineering."

However, after running over 1,000 tests, one framework consistently outperformed the others. Every. Single. Time.

I call it The DEPTH Method.

Here's how it works (and why you'll never write another one-liner prompt again):

D - Define Multiple Perspectives
Stop asking ChatGPT to "write a marketing email." That's lazy.
Tell it: *"You are three experts - a behavioral psychologist, a viral copywriter, and a data analyst. Work together to write..."*
Now you're giving it brains, creativity, and logic at once.

E - Establish Success Metrics
Don't say "make it good."
Say: *"Optimize for a 40% open rate, 12% CTR, and use three psychological triggers."*
AI needs direction, not dreams.

P - Provide Context Layers
Never say "for my business." That's useless.
Try: *"Context: B2B SaaS, $200/m product, founders are exhausted, last emails got 20% open."*
The richer the context, the smarter the output.

T - Task Breakdown
Instead of "create a campaign," say:
Step 1: Identify pain points. Step 2: Create the hook. Step 3: Build value. Step 4: Add a soft CTA.
Break the task before AI breaks the logic.

H - Human Feedback Loop
Stop accepting the first output.
Tell it: *"Rate your response 1-10 on clarity, persuasiveness, and originality. Rewrite anything under 8."*
That one line fixes half of AI's mediocrity.

I tested this with a real prompt for LinkedIn.
The setup: three experts - a neuroscientist, a viral creator, and a Fortune 500 conversion optimizer.

The task: write a short post about AI replacing jobs, targeted at CEOs terrified of being left behind.
Result? 14% engagement, 47 comments, and three new clients.

That's not theory. That's data.

Here’s what I learned after 1,000+ tests:

• Single-role prompts create bland outputs.

• Without metrics, there’s no improvement.

• Context multiplies relevance.

• Breaking tasks removes confusion.

• Self-feedback makes AI 10× sharper.

So yeah, forget the fancy “mega prompts.”
Run your worst ChatGPT output through DEPTH once. You’ll see it transform.

Follow me if you want more real-world prompts and frameworks that make AI sound less like a robot - and more like someone worth reading.
